Title

- **Project Name:** Smart Symptom Triage & Care Navigaton Assiatant
- **Tagline:** Intelligent symptom analysis for faster, safer healthcare decisions
- **Team Name:** Super Challengers
- **Event:** DevCraft: Simon's Command Line
- **Date**: 06/04/2026
- **Domain:** Healthcare / AI / Web Application

Problem Statement

Healthcare systems face overcrowding because many patients visit hospitals for non-emergency issues, while critical patients experience dangerous delays. People often lack proper guidance to understand the seriousness of their symptoms. Current solutions are either too generic or confusing, leading to poor decision-making and unnecessary stress.

Target Audience

- **Primary Users**
  Individuals experiencing symptoms
  First-time patients unsure about seriousness
- **Secondary Users**
  Rural & remote populations
  Students & working professionals
- **Institutional Users**
  Clinics for pre-screening
  Hospitals to reduce OPD overload

Existing Solutions

Solution Type	Strength
Google Search	Fast
WebMD-like tools	Informative
Telemedicine	Expert advice

Gaps & Opportunities

- No instant and clear decision-making system
- Lack of personalized symptom analysis
- No prioritization of emergency cases
- Poor accessibility for beginners/non-medical users

Your Solution

MEDIGUIDE is an AI-powered web application that:

- Accepts user symptoms in simple language
- Analyzes severity using intelligent algorithms
- Classifies cases into:
  - Emergency
  - Moderate
  - Mild
- Provides clear action steps (ER visit, doctor consult, or home care)

Key Features

- 🧠 AI-based symptom analysis
- ⚡ Instant response (within seconds)
- 🚨 Emergency detection alerts
- 📊 Severity classification system
- 💬 Simple and clean user interface
- 🌐 Accessible on any device (web-based)

System Architecture

- **Frontend:** User inputs symptoms via web UI
- **Backend:** Handles logic and API requests
- **AI Engine:** Processes symptoms using rules/ML
- **Database:** Stores symptom-disease mapping
- **Output Layer:** Displays recommendations

Flow:

Tech Stack

- **Frontend:** HTML, CSS, JavaScript
- **Backend:** Python (Flask) / Node.js
- **AI Model:** KNN Algorithm / Rule-based logic
- **Database:** Firebase / MongoDB
- **Tools:** VS Code, GitHub

Workflow

- User opens MEDIGUIDE
- Inputs symptoms (e.g., fever, chest pain)
- System preprocesses input
- AI model evaluates symptom patterns
- Severity level is determined
- Recommendation is generated
- Result shown clearly to user

Impact

- 🏥 Reduces unnecessary hospital visits
- ⏱️ Saves time for both patients and doctors
- 🚑 Helps identify emergency cases early
- 🌍 Improves healthcare access in remote areas
- 💡 Promotes awareness and smarter decisions

Future Scope

- 🎤 Voice-based symptom input
- 📱 Mobile application (Android/iOS)
- 🌐 Multi-language support (regional languages)
- 🤝 Integration with hospitals & ambulance services
- 👨‍⚕️ Live doctor consultation feature
- 📡 Real-time health monitoring (IoT integration)

Team Info

Member 1: Frontend Developer (UI Design & Interaction)
Member 2: Backend Developer (Server & APIs)
Member 3: AI/ML Developer (Model & Logic)
Member 4: UI/UX Designer (User Experience & Layout)
